

Formatted string literals - **f-strings**

```
print(f>Your name is {player_name}, you are a knight")
```

└┘
1

└──────────┘
2

1. **f** prefix before the string tells Python that it's an **f-string**
2. This is an **expression** in between curly braces **{ }**
In this example, it's a variable called **player_name**.
